Overview

Module Description

The CYBLE-022001-00 module is a complete module designed to be soldered to the applications main board.

Module Dimensions and Drawing

Cypress reserves the right to select components (including the appropriate BLE device) from various vendors to achieve the BLE module functionality. Such selections will still guarantee that all height restrictions of the component area are maintained. Designs should be held within the physical dimensions shown in the mechanical drawings in [Figure 1](#). All dimensions are in millimeters (mm).

Pad Connection Interface

As shown in the bottom view of [Figure 1](#) on page 5, the CYBLE-022001-00 connects to the host board via solder pads on the back of the module. [Table 2](#) and [Figure 2](#) detail the solder pad length, width, and pitch dimensions of the CYBLE-022001-00 module.

Figure 2. Solder Pad Dimensions (Seen from Bottom)

To maximize RF performance, the host layout should follow these recommendations:

1. The ideal placement of the Cypress BLE module is in a corner of the host board with the chip antenna located at the far corner. This placement minimizes the additional recommended keep out area stated in item 2. Refer to [AN96841](#) for module placement best practices.
2. To maximize RF performance, the area immediately around the Cypress BLE module chip antenna should contain an additional keep out area, where no grounding or signal traces are contained. The keep out area applies to all layers of the host board. The recommended dimensions of the host PCB keep out area are shown in [Figure 3](#) (dimensions are in mm).

Recommended Host PCB Layout

Figure 4, Figure 5, Figure 6, and Table 3 provide details that can be used for the recommended host PCB layout pattern for the CYBLE-022001-00. Dimensions are in millimeters unless otherwise noted. Pad length of 0.91 mm (0.455 mm from center of the pad on either side) shown in Figure 6 is the minimum recommended host pad length. The host PCB layout pattern can be completed using either Figure 4, Figure 5, or Figure 6. It is not necessary to use all figures to complete the host PCB layout pattern.

Notes

- TCPWM stands for timer, counter, and PWM. If supported, the pad can be configured to any of these peripheral functions.
- TCPWM connections on ports 0, 1, 2, and 3 can be routed through the Digital Signal Interconnect (DSI) to any of the TCPWM blocks and can be either positive or negative polarity. TCPWM connections on ports 4 and 5 are direct and can only be used with the specified TCPWM block and polarity specified above.
- The main board needs to connect both GND connections (Pad 1 and Pad 10) on the module to the common ground of the system.
- When using the capacitive sensing functionality, Pad 2 (P4.1) can be connected to a C_{TANK} capacitor (located off of Cypress BLE Module). C_{TANK} should be used if implementing a shield layer on the capacitive sensor. If used, this capacitor should be placed as close to the module as possible.
- When using the capacitive sensing functionality, Pad 21 (P4.0) must be connected to a C_{MOD} capacitor (located off of Cypress BLE Module). The value of this capacitor is 2.2 nF and should be placed as close to the module as possible.
- If the I²S feature is used in the design, the I²S pins shall be dynamically routed to the appropriate available GPIO by PSoC Creator

Power Supply Connections and Recommended External Components

Power Connections

The CYBLE-022001-00 contains two power supply connections, VDD and VDDR. The VDD connection supplies power for both digital and analog device operation. The VDDR connection supplies power for the device radio.

VDD accepts a supply range of 1.71 V to 5.5 V. VDDR accepts a supply range of 1.9 V to 5.5 V. These specifications can be found in Table 9. The maximum power supply ripple for both power connections on the module is 100 mV, as shown in Table 7.

The power supply ramp rate of VDD must be equal to or greater than that of VDDR.

Connection Options

Two connection options are available for any application:

1. Single supply: Connect VDD and VDDR to the same supply.
2. Independent supply: Power VDD and VDDR separately.

External Component Recommendation

In either connection scenario, it is recommended to place an external ferrite bead between the supply and the module connection. The ferrite bead should be positioned as close as possible to the module pin connection.

Figure 7 details the recommended host schematic options for a single supply scenario. The use of one or two ferrite beads will depend on the specific application and configuration of the CYBLE-022001-00.

Figure 8 details the recommended host schematic for an independent supply scenario.

The recommended ferrite bead value is 330 Ω , 100 MHz (Murata BLM21PG331SN1D).

Figure 7. Recommended Host Schematic Options for a Single Supply Option

ESD: Module integrated into system Components ^[11]	–	15 kV Air 2.2 kV Contact

ESD and EMI Protection

Exposed components require special attention to ESD and electromagnetic interference (EMI).

A grounded conductive layer inside the device enclosure is suggested for EMI and ESD performance. Any openings in the enclosure near the module should be surrounded by a grounded conductive layer to provide ESD protection and a low-impedance path to ground.

Device Handling: Proper ESD protocol must be followed in manufacturing to ensure component reliability.

Note

11. This does not apply to the RF pins (ANT, XTALI, and XTALO). RF pins (ANT, XTALI, and XTALO) are tested for 500-V HBM.

Regulatory Information

FCC

FCC NOTICE:

The device CYBLE-022001-00, including the antenna 2450AT18B100 from Johanson Technology, complies with Part 15 of the FCC Rules. The device meets the requirements for modular transmitter approval as detailed in FCC public Notice DA00-1407.transmitter Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

CAUTION:

The FCC requires the user to be notified that any changes or modifications made to this device that are not expressly approved by Cypress Semiconductor may void the user's authority to operate the equipment.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help

LABELING REQUIREMENTS:

The Original Equipment Manufacturer (OEM) must ensure that FCC labelling requirements are met. This includes a clearly visible label on the outside of the OEM enclosure specifying the appropriate Cypress Semiconductor FCC identifier for this product as well as the FCC Notice above. The FCC identifier is FCC ID: WAP2001.

In any case the end product must be labeled exterior with "Contains FCC ID: WAP2001"

ANTENNA WARNING:

This device is tested with a standard SMA connector and with the antennas listed below. When integrated in the OEMs product, these fixed antennas require installation preventing end-users from replacing them with non-approved antennas. Any antenna not in the following table must be tested to comply with FCC Section 15.203 for unique antenna connectors and Section 15.247 for emissions.

RF EXPOSURE:

To comply with FCC RF Exposure requirements, the Original Equipment Manufacturer (OEM) must ensure to install the approved antenna in the previous.

The preceding statement must be included as a CAUTION statement in manuals, for products operating with the approved antennas in [Table 6](#) on page 12, to alert users on FCC RF Exposure compliance. Any notification to the end user of installation or removal instructions about the integrated radio module is not allowed.

The radiated output power of CYBLE-022001-00 with the chip antenna mounted (FCC ID: WAP2001) is far below the FCC radio frequency exposure limits. Nevertheless, use CYBLE-022001-00 in such a manner that minimizes the potential for human contact during normal operation.

End users may not be provided with the module installation instructions. OEM integrators and end users must be provided with transmitter operating conditions for satisfying RF exposure compliance.
